## 1 Time Tracking Table

#### 2 Vulnerabilities Overview

Based on our testing, we identified the following vulnerabilities for the Secode21 Bank and the OnlineBanking Bank:

#### 2.1 Secode21

#### 2.1.1 Static Session ID

Likelihood: *high*Implication: *high* 

•Risk: *high* 

•Reference: OWASP OTG-SESS-003 (see section ?? )

The session id is saved in form of the (static) user id in a cookie. This cookie can be used on any machine to take over the account of a user. The lifetime of this cookie is only limited by the cookie lifetime field.

#### 2.1.2 Stored XSS in Registration

Likelihood: *medium*Implication: *high* 

•Risk: *high* 

•Reference: OWASP OTG-INPVAL-002 (see section ?? )

Using stored cross-site-scripting attacks, one can inject JavaScript code, that is run, when the Administrator/Employee logs in. Arbitrary code can be loaded from a third party page.

#### 2.1.3 Missing Lock Out Mechanism

Likelihood: *high*Implication: *medium* 

•Risk: medium

•Reference: OWASP OTG-AUTHN-003 (see section ??)

The application has no lock out mechanism, which allows brute force attacks on known usernames and testing for a valid password

#### 2.2 Team3 Online Banking

#### 2.3 Vulnerability Overview

## 3 Detailed Report

The following pages describe for each test how both applications Secode21 and Online Banking Bank performed. The test is divided in different sections following the OWASP Testing Guide v4.

## 3.1 Configuration and Deploy Management Testing

## 3.1.1 Test File Extensions Handling for Sensitive Information (OTG-CONFIG-003)

	Zinemio di o
Secode21	Impact: 5
	Risk:5
	Secode21
Observation	File extensions are handled correctly but while testing we found
	a folder called SQL with sql files and pdf files describing the
	database structure and the sql commands used by the web appli- cation.
Discovery	Thanks to the tool <i>dotdotpwn</i> , that tries automatically different
Discovery	URLs, we found the SQL folder. We passed the following param-
	eters:
Likelihood	The likelihood is quite high that someone tries a tool to find
	these kind of vulnerabilities. There is no need for special knowl-
	edge because the tools work quite automatically without much
	configuration.
Implication	These vulnerabilities could help attackers to perform sql injection
	attacks because you know the database structure and the sql
	commands used in the implementation of the web application.
Recommendations	Block the access to sql files and to those folders that describe the
	web applications architecture.
Comparison	Our web application handles file extensions correctly, but it is
	possible to access the compiled c program that handles the batch
	files. This is a problem because you can reverse engineer the code
	and use the vulnerabilities found. This scenario is possible but is
	very complex.

Likelihood: 8

Metric	Value
Access Vector	N
Attack Complexity	L
Privileges Required	N
User Interaction	N
Scope	U
Confidentiality Impact	L
Integrity Impact	N
Availability Impact	N

#### 3.1.2 Test HTTP Methods (OTG-CONFIG-006)

	Likelihood: 8
Secode21	Impact: 5
	Risk:5

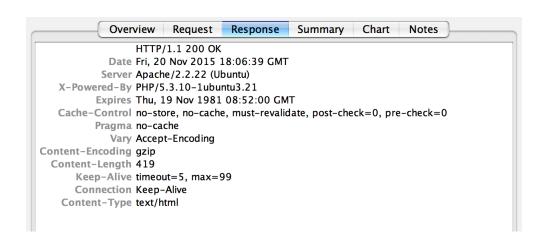

HUNO					
Secode21					
Observation	We did not observe any notable behavior.				
Discovery	We used the Zed Attack Proxy (ZAP) to change the HTTP requests method to the ones listed below. The requests that were allowed responded with the index page or an empty body. The rejected requests responded with an error message in the body. Methods that were allowed  • HEAD  • OPTIONS				
	• GET • POST				
	• PUT				
	Methods that were rejected				
	• TRACE				
	• CONNECT				
Likelihood	N/A				
Implication	N/A				
Recommendations	N/A				
Comparison					

#### 3.1.3 Test HTTP Strict Transport Security (OTG-CONFIG-007)

Secode21 Likelihood: 8
Impact: 5
Risk:5

Secode21				
Observation	The HTTP Strict Transport Security protocol is never used.			
Discovery	We used <i>Charles Web Proxy</i> to check the HTTP response headers			
	and the Strict-Transport-Security header was not found.			
Likelihood	N/A			
Implication	N/A			
Recommendations	It would be better so transport some data via https and use the			
	HSTS protocol.			
Comparison	The same results apply for our web application.			

Metric	Value
Access Vector	N
Attack Complexity	L
Privileges Required	N
User Interaction	N
Scope	U
Confidentiality Impact	L
Integrity Impact	N
Availability Impact	N

#### 3.1.4 Test RIA cross domain policy (OTG-CONFIG-008)

Secode21 Likelihood: 8
Impact: 5
Risk:5

Secode21				
Observation There are no RIA applications on the system and ther				
	crossdomain.xml file provided.			
Discovery	Using wget we tried to find a crossdomain.xml or clientaccesspol-			
	icy.xml file and couldn't find it.			
Likelihood	N/A			
Implication	N/A			
Recommendations	N/A			
Comparison	The same results applies for our web application.			

Metric	Value
Access Vector	N/A
Attack Complexity	N/A
Privileges Required	N/A
User Interaction	N/A
Scope	N/A
Confidentiality Impact	N/A
Integrity Impact	N/A
Availability Impact	N/A

## 3.2 Identity Management Testing

3.2.1 Test Role Definitions(OTG-IDENT-001)

3.2.2	<b>Test</b>	User	Registra	ition	Process(C	<b>OTG</b>	-IDEN	NT-002)

---	-------	--------------------	---------	-------------	--------------------

## 3.6 Data Validation Testing

## 3.6.1 Testing for Reflected Cross Site Scripting(OTG-INPVAL-001)

	Likelihood: 8
Secode21	Impact: 5
	Risk:5
	Secode21
Observation	We observed no reflected cross site scripting vulnerability.
Discovery	It seems that all parameters are stored in the database before
	inserting the values in the HTML.
Likelihood	N/A
Implication	N/A
Recommendations	N/A
Comparison	The same results apply for our web application.

## 3.6.2 Testing for Stored Cross Site Scripting(OTG-INPVAL-002)

	Likelihood: 8				
Secode21	Impact: 5				
	Risk:5				
	Secode21				
Observation	We observed several possibilities to execute a stored XSS attack.				
	But not all of them could be exploited as the length of the corre-				
	sponding database fields was often very restricted. We manually				
	tried to inject JavaScript code in every input field. Therefore we				
	used the following code, which just alerts a message.				
Discovery	We inserted Javascript code in the name field on the register page.				
	When we logged in as an employee the script was executed. There				
	were cases when the script caused for new registered users after				
	the script was entered to not appear.				
Likelihood	This vulnerability can be easily detected, but require some				
	JavaScript knowledge to exploit it. Therefore we estimated the				
	likelihood to be medium.				
Implication	The implications are severe as we proofed that it is possible to				
	steal the session. As we injected the code on the admin landing-				
	page, which implies that we were able to act as an admin and				
	register an abitrary account.				
Recommendations	Implement a input sanitation on all input fields on the backend				
	side! Try to use whitelisting for the different datatypes and do				
	not rely on the frontend input validation.				
Comparison					

Metric	Value
Access Vector	N
Attack Complexity	M
Privileges Required	N
User Interaction	Y
Scope	U
Confidentiality Impact	M
Integrity Impact	M
Availability Impact	L

## 3.6.11 Testing for HTTP Splitting/Smuggling(OTG-INPVAL-016)

## 3.7 Error Handling

#### Team21

Team21 does not provide a lot of error messages for incorrect inputs (e.g. incorrect TAN length, wrong TAN, TAN used).

Based on the client side input validation, there are also no messages for manipulated input via proxy or by removing the validation patterns, which can lead to problems. Examples would be a malformated email which results in a not working account or a longer input then expected, which cuts off the end of the input. There are some cases when the page returns the path of the file where the error occurred.
